Why Do We Need Two Eyes?

Seeing with two eyes enables us to tell exactly where objects are. Try a little experiment. With both eyes open, draw a small circle on a piece of paper. Next, close one eye and try to add a dot in the center. You may find this hard to do with only one eye open.

Put your palms together in front of your face. Now, with both eyes open, look straight ahead and move your hands apart. See how far apart you can move them and still be able to see them with both eyes.

Now try doing it with one eye closed. It can be either eye. But notice how the hand that is on the same side as the closed eye disappears much faster than it did when you were watching it with two eyes.

Why Do Our Baby Teeth Fall Out?

Our baby teeth start to fall out when we are about six years old. They are replaced by bigger adult teeth that we should look after for the rest of our lives.

Adults have more teeth

Grown-ups have more teeth than children. Children have 20 teeth in all. The molars at the back do not appear until much later

Animals grow new teeth too

Some animals, such as horses and lions, grow new teeth just once in their lives too.

Like people, their grown-up teeth push out the baby teeth. Reptiles, such as snakes and crocodiles, may have several sets of teeth during their lives.

3. Apply different alignments in each paragraph. Save the activity as **Teeth Fall Out**.
